5 A method for correcting for the offset carrier frequency in
a wireless modem is provided. The method further allows for the
periodic correction of the offset of the carrier frequency. A
Fine tuning method is implemented that uses fine tuning
10 frequency increments to determine minimum and maximum edges of a
received frequency from which to calculate an offset used to
adjust the transmitted frequency or the receiver of the wireless
modem. Power correction is performed for variances in received
signal power by adjusting an output power relative to
15 differences in received power compared to an expected received
power value.
